87. A method for determining whether an individual is at risk for a hematological disorder, comprising:

providing a blood sample of an individual; and comparing the level of the polypeptide comprising the amino acid sequence of SEQ ID NO:1 in the blood sample to the level of said polypeptide in a control sample from a healthy subject, wherein a lower level in the sample from the individual is an indication that the individual is at risk for a hematological disorder.

- 88. A method for screening a cell to identify an agent that binds with a polypeptide having an amino acid sequence shown in SEQ ID NO:1 in said cell, said method comprising contacting said cell with an agent and detecting an interaction between said polypeptide and agent.
- 89. A method for screening a cell to identify an agent that modulates the expression level or activity of the polypeptide having an amino acid sequence shown in SEQ ID NO:1 in said cell, said method comprising contacting said cell with an agent and detecting an interaction between said polypeptide and agent.
  - 90. The method of claim 89, wherein said cell is a blood cell.
- 91. The method of claim 90, wherein said blood cell is a myeloid progenitor cell.
- 92. The method of claim 91, wherein said myeloid progenitor cell is a CD34<sup>+</sup> cell.

- 93. The method of claim 89, wherein said agent increases the level or activity of said polypeptide.
- 94. The method of claim 89, wherein said agent decreases the level or activity of said polypeptide.
- 95. A method for assessing G-protein receptor expression in disease states of a patient, comprising contacting a tissue of said patient with an isolated antibody that selectively binds to the polypeptide shown in SEQ ID NO:1.
- 96. The method of claim 95, wherein the G-protein coupled receptor expression is involved in signal transduction.
- 97. A method for delivering a chemotherapeutic agent to a mammalian cell which is abnormally expressing a G-protein coupled receptor, wherein said method comprises contacting said cell with the polypeptide having an amino acids sequence shown in SEQ ID NO:1 or an isolated antibody which selectively binds said polypeptide.
  - 98. The method of claim 97, wherein said mammalian cell is a blood cell.
- 99. The method of claim 97, wherein said mammalian cell is a myeloid progenitor cell.
- 100. The method of claim 99, wherein said myeloid progenitor cell is a CD34<sup>+</sup> cell.
  - 101. A method for treating a hematological disorder in a patient comprising

Bland
